Back Pain & Hip Rotation Fix

Sleep in Alignment.
Wake Without Tension.

RiseByNight

Why Back Pain Happens at Night

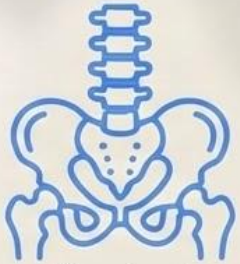

- Pelvis rotates when hips lack support
- Lower-back muscles stay “active” while sleeping
- Incorrect pillow height shifts spinal alignment
- Tight hip flexors = morning stiffness
- Twisting positions compress nerves

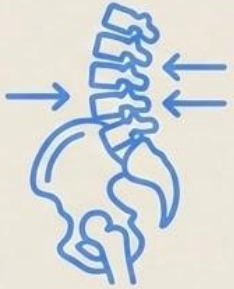

RiseByNight

The Pelvis Alignment Breakdown

- Neutral pelvis = relaxed back muscles
- Tilted pelvis = compressed lower spine
- Tight hips pull the spine out of alignment
- Proper sleep posture resets nighttime tension

Neutral

Tilted & Tight Hips

RiseByNight

Ideal Hip & Back Alignment

- Hips stay level — no collapsing
- Lower back stays naturally curved
- Knees supported to reduce hip rotation
- Spine forms a neutral line from neck to pelvis

Ideal Alignment

RiseByNight

How Hip Rotation Causes Back Pain

- Top leg falls forward → pelvis twists
- Spine rotates → lower-back tension
- Muscles tighten to “stabilize” your posture
- Waking up stiff = misalignment during sleep

RiseByNight

The Top Leg Collapse Problem

- When the top leg falls forward, the pelvis twists
- This rotation pulls the lower spine out of alignment
- Back muscles activate to “stabilize” your posture
- This is one of the biggest causes of morning back pain

Top Leg Collapse

RiseByNight

Why You Need Knee Support

- Knee support prevents pelvic rotation
- Hips stay level and stable
- Lower-back muscles fully relax
- Reduces twisting and nerve
- Reduces twisting and nerve compression
- Essential for side sleepers with back pain

With Knee Support

RiseByNight

Micro-Corrections for Perfect Alignment

- Keep knees stacked or slightly forward
- Avoid letting your upper body twist
- Pull the pillow slightly into your shoulder
- Maintain a neutral chin position
- Let hips relax — don’t force posture

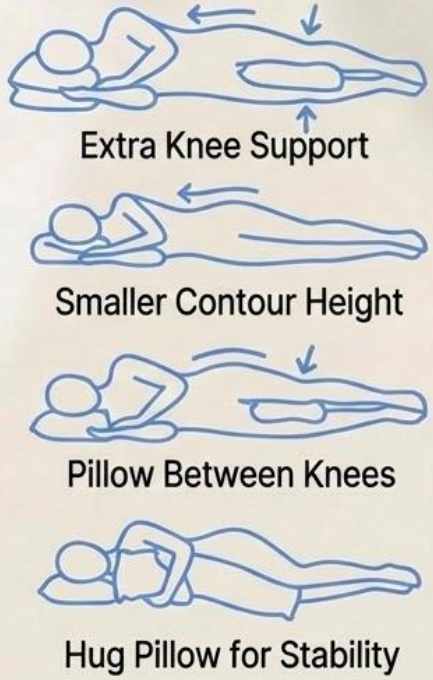

Micro-Correction Areas

RiseByNight

Sleeping Positions for Each Body Type

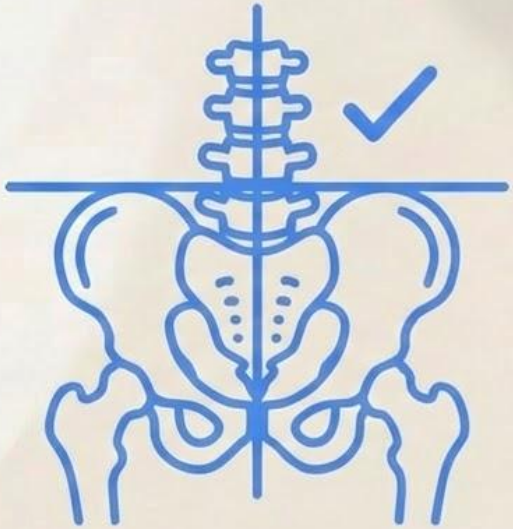

- Broad Shoulders: Add extra knee support to keep pelvis neutral.
- Narrow Shoulders: Use smaller contour height to avoid spine drop.
- Tight Hips: Extra pillow between knees reduces rotation.
- Hypermobile: Keep upper body stabilized with a hug pillow.

RiseByNight

3 Signs Your Hips Are Aligned Correctly

- ✓ Lower back feels relaxed instead of tight
- ✓ Knees rest naturally on each other or supported
- ✓ Pelvis feels “level,” not twisted or pulled forward

RiseByNight

Before & After Hip Alignment

Before:

- Pelvis twisted
- Lower-back muscles activated
- Uneven pressure on hips
- Morning stiffness & pinching

After:

- Hips level and neutral
- Fully relaxed lumbar muscles
- Spine aligned head-to-pelvis
- Wake up without tightness

RiseByNight

How to Stabilize Your Hips Overnight

- Support between knees prevents rotation
- Hug a pillow to stop upper-body twisting
- Keep knees aligned or slightly forward
- Avoid sleeping half on your stomach
- Let hips relax — no forced posture

RiseByNight

Back Sleeper Hip Alignment

- Keep knees slightly elevated
- Pelvis stays neutral — no arching
- Lower back rests comfortably
- Keep head aligned with spine
- Ideal for people with tight hip flexors

RiseByNight

Your Hip Alignment Transformation

- Week 1: Reduced morning stiffness
- Week 2: Noticeable back & hip relief
- Week 4: Consistent, deep sleep with neutral pelvis
- Long-term: Less tension, more energy, better recovery

Bonus: Better alignment at night → better movement during the day.
